Not illustrated. 1878 Excerpt: .as the tensions differ more or less from such as are represented in figure 15, the line where the surfaces A-B, B-C, C-A meet will be in stable equilibrium with respect to the formation of such a mass as we have considered, since $W_s - W_v$ will be positive. The same will be true for less values of $/D$. For greater values of o , the value of $TPS - W_v$, which measures the stability with respect to the kind of change considered, diminishes. It does not vanish, according to our equations, for finite values of Jud . But these equations are not to be trusted beyond the limit at which the mass D ceases to be of sensible magnitude. But when the tensions are such as we now suppose, we must also consider the possible formation of a mass D within a closed figure in which the surfaces $D-A$, $D-B$, $D-C$ meet together (with the surfaces $A-B$, $B-C$, $C-A$) in two opposite points. If such a figure is to be in equilibrium, the six tensions must be such as can be represented by See note on page 455. We may here add that the linear tension there mentioned may have a negative value. This would be the case with respect to a line in which three surfaces of discontinuity are regarded as meeting, but where nevertheless there really exists in stable equilibrium a filament of different phase from the three surrounding masses. The value of the linear tension for the supposed line,...
